

Wiring your TD-4A

Depending on the number of lights and what you want them to do will determine how they are wired. Note that one of the wires running from the light(s) has a white strip running down it. This is the positive wire into the light. Depending on your application and how you have chosen it/them to light, it will be tied into the existing running, parking or turn signal/brake circuits.

The solid black wire is the ground wire for the light(s) and if using multiple lights can be tied together and run to a good ground.
